#### The Space Between Us: A Novel Collaborative Spacecraft Estimating Framework

Project Controls Expo September 2023

....

#### Agenda

Ask Us About Our Long-Form Research Paper!

- Introduction & The Space Community
- Parametrics & Today's Environment
- SPACEFRAME: Behind the Curtain
- A Realistic Case Study
- Takeaways & Best Practices
- Next Steps

#### The Team

Benjamin Truskin Service Area Manager

Ben is an employee owner and ICEAA Certified Cost Estimator/Analyst (CCEA) Technomics with 10 years experience providing data-driven decisions to leaders. He has provided support to groups within the IC, DoD, and Civilian space. Ben's experience includes: cost estimation and phasing, data policy and normalization, methods development, source selection support, industry interface, database requirements development. He received his MS and BS in Aerospace Engineering from The Pennsylvania State University.

Alex Wekluk Service Area Manager

Alex Wekluk is an ICEAA Certified Cost Estimator/Analyst (CCEA) and Employee Owner at Technomics. He has nearly twenty years of experience performing cost, risk, and technical analyses for the DoD and the IC. He secured a USPTO patent for weapon design work and earned the IC Meritorious Unit Citation for exemplary cost-reduction analysis. He holds a BS in Mechanical Engineering from Virginia Tech and a MA in Economics from George Mason University.

### Space, It's Big

• As an industry, space is big and rapidly growing, both nationally and internationally

- Growth spans commercial, civil, military, intelligence functions
- As business models and technology mature, government is looking for beneficial partnerships
- Projected to grow from \$469B in 2021 to >\$1T by 2040

#### Space Cost Community Challenges

There is a significant opportunity for greater comparability and increased collaboration leading to improved methods and models across the community

A common framework allows agencies to readily compare models and methods!

#### What Are Parametric Methods?

- Parametrics are just data-driven equations relating a dependent variable and independent variable(s)
  - Cost Estimating Relationship (CER) = Cost as the dependent variable
- Parametrics are a strong estimating method to use when:
  - Too early for engineering buildup or extrapolation of actuals
  - Basic understanding of key technical parameters is known
- CERs can be as simple as this example, or much more complex
  - Multi-variate
  - Non-linear
  - Piece-wise

### Method Comparability Challenges

#### **Application**

- Cost Estimating Relationships are not all equal Various ways to define system heritage... What scope are you solving for? Units of measure (e.g. Pounds vs. kilograms) \$/month vs. Total \$ What is meant by 'Total Cost'? What program phases? What burdens and taxes? What types of acquisitions apply? **Functional Forms** Systems Engineering Integration & Test, **Project Management** •  $\$ = a * Mass^b * c^{Stratifier}$  vs.  $\$ = a * Mass^b *$ Groups don't track activities to the same levels! Stratifier<sup>c</sup> How you normalize affects how methods are A small-looking change with big impacts developed 2 term linear CER vs. 6 term non-linear piecewise Reliance on underlying estimates (aka base) CER Sub-models as inputs to methods
  - Is the sub-model released?!

Variable Definitions

#### Welcome to SPACEFRAME

- Space Parametric Cost Estimating Framework (SPACEFRAME) is a framework of parametric cost models tailored to space systems
  - Incorporates existing, released methods
  - Modular methods to be incorporated into an Excel-based methods library
  - Allows for additional method inclusion as well as updated existing methods as they are released to the broader community – focus on space systems, could potentially apply to various other commodities
- A collection of methods from a variety of organizations, spanning levels of space system WBS

#### **Space System Estimating Introduction**

By Swpb - Own work, with images in the public domain, CC BY-SA 4.0, https://commons.wikimedia.org/w/index.php?curid=46334310

#### **SPACEFRAME** Architecture

### **Technical Inputs to SPACEFRAME**

#### **Globals**

- Estimating inputs needed throughout
  - Inflation
  - Estimate Base/Common Year
  - Schedule
- Scope (e.g., Launch, Ground, Operations)
- Client specific inputs are easy to add and document. Examples we've used include:
  - Foreign exchange factors
  - Mission Assurance adjustments
  - Simplified Risk Factors

#### **Technical Baseline**

- Standardized Datasheets inform space estimating methods
  - Mass
  - Quantities
  - Heritage
- May also include other technical measures (depending on methods selected
  - E.g., Optics size, Transmission Power, Solar Array Area, Structure Material Type

### A Common Methods Library (Simplified Example)

- The backbone enabling SPACEFRAME automation!
  - Significant effort was expended to standardize, enabling the automatic calculation

#### **REC Subsystem CERs**

CER	Ind Var 1	Ind Var 2	Ind Var 3	Ind Var 4	Ind Var 5	Ind Var 6	BY	Adj	NR Pair	Dep Var	Form
	Maximum Power										100*Mass (lb)^0.5*BPC^-0.2*Maximum Power
Org A_REC_Widget X	(W)	New Tech? (1/0)					2000	1	Org A_NR_Widget X	AUC (BY00\$k)	(W)^0.3*1.2^New Tech?
Org B_REC_Widget X	Gimbaled? (e/1)						2000	1	Org B_NR_Widget X	T1 (BY00\$k)	150*Mass (lb)^0.7*BPC^-0.3*Gimbaled?^0.2
							:				
							:	1	i i	1	
							:				
											80*Mass (lb)^0.9*BPC^-0.1*Data Rate
Org D_REC_Widget Z	Data Rate (Mbps)	Multi-channel? (1/0)					2020	1	Org D_NR_Widget Z	AUC (BY20\$k)	(Mbps)^(0.01-0.1*Multi-channel?)

- Technomics has curated 225+ disparate methods into a common structure
  - Spans 6 major categories of CERs, as well as other types of estimating relationships

#### **Standardized Outputs**

Element	2024	2025	2026	2027	2028	Prior	FYDP	Future	Total
Total (TY\$M)	370.6	445.8	417.1	316.2	214.3	101.5	1,764.1	432.9	2,298.4
Space System	329.7	398.6	371.9	290.8	197.0	35.5	1,588.0	230.4	1 <i>,</i> 853.9
Pre-Acquisition	-	-	-	-	-	53.4	-	-	53.4
Other Gov't Costs	28.9	34.9	32.6	25.5	17.3	12.5	139.0	20.2	171.7

#### **Case Study Context**

Case Study 2

Case Study 4

- Unfortunately, organizations don't spend millions or more to build space systems just to satisfy the curiosity of cost analysts!
- Our case study will focus on a fictional 'simple' spacecraft
  - Communications System, single unit
- Case Study is representative of an acquisition any space organization may undertake

Case Study 1

Case Study 3

#### Case Study 1: Bus Boxes & Subsystems

Bus

- ACS Subsystem Star Tracker
- Inertial Reference Unit

Control Moment Gyros

- Attitude Control Electronics
- EPS Subsystem

Solar Array Wing

Li-Ion Batteries

Power Converter (Bus to PL)

EPS Cables & Harnesses

PRS Subsystem

Fuel Tank

Thruster A

Propulsion Interface Unit

SMS&TCS Subsystem

Primary Structures

Secondary Structures

Heat Pipes & Radiators

MLI Blankets

TT&C Subsystem

GPS Antenna (Helix)

Narrowband (NB) Patch Antenna

NB Receiver

Command Relay Unit

Snippet of WBS

- For Case Study 1, team estimated bus subsystem costs: positioning (ACS), power (EPS), propulsion (PRS), structures / thermal (SMS/TCS), and commanding (TT&C) at box-level
- Boxes include solar arrays, batteries, star trackers, electronics, thrusters, GPS antennas and command receivers
- Discovered significant difference in estimates, especially in NR

Integratio

and Test

Manageme (PM)

#### Case Study 1: Bus Boxes & Subsystems

• Discovered large differences in allocation of costs between subsystems, and in spread around NR estimates vs R estimates

### Case Study 2: Communications Payload

 For Case Study 2: team estimated the cost of communications mission payload

**Comm Payloads** 

Data Storage Unit

**CPL** Waveguide

**CPL TWTA** 

**CPL** Receiver

Antenna Boom CPL Antenna Dish

CPL Antenna Feed CPL Gimbal Assembly

CPL Command Unit

WB Comm Structure

CPL Pallet & Enclosure

WB Comm Electronics

CPL Passive Signal Flow Control

CPL Frequency & Timing Unit

- Boxes include data storage unit, commanding, waveguides, receivers, antenna and antenna boom
  - Discovered extreme differences in estimates and NR to R ratios, which are representative of the amount of design work

#### Case Study 2: Communications Payload

 Discovered A and B appear to estimate in similar way, C could not break out at this level, and D was considerably higher

# Case Study 3: Space System Levels of Integration

- For Case Study 3: team estimated the cost of SE/IT/PM
- Case Study 3 leverages Case Studies 1 and 2 since these costs add on to bus and payload levels
- SE/IT/PM costs are challenging because they apply at all levels and different orgs book differently

#### Case Study 3: SEITPM

- Discovered large differences in booking between various levels for Org C compared to all other organizations
- In total, the estimate deltas actually (unexpectedly) smoothed out a bit when layering on SEITPM
- This may indicate large normalization differences between organizations - worthy of further study

### Case Study 4: Mission Assurance/Class

- For Case Study 4: team examined effect of mission assurance and mission class on cost
- Case Study 4 leverages Case Studies 1, 2 and 3 – an entire satellite!
- Treatment of mission class for estimates
  - Some organizations do not address mission class at all in their methods
  - Some organizations treat class as an independent variable in CERs
  - Others handle with complexity factor
- Adjustments based on mission assurance can reduce estimate by up to 80%!!

#### <u>Considerations for Class A - Class D NASA</u> <u>Missions and Instruments</u>

Mission and Instrument Risk Classification Considerations							
	Very High:	Class A					
(Relevance to Agency Strategic Plan,	High:	Class B					
National Significance, Significance to the Agency and Strategic Partners)	rument Risk Classification Considerations   regic Plan,   nificance   Partners)   Low:   Low:   Low:   Short, 3 Years > - > 3 Years   Short, 3 Years > - > 1 Years:   Brief, < 1 Year:	Class C					
		Class D					
	Long, > 5 Years:	Class A					
Primary Mission Lifetime	Medium, 5 Years > - > 3 Years:	Class B					
	Short, 3 Years > - > 1Years:	Class C					
	Brief, < 1 Year:	Class D					
Complexity and Challenges	Very High:   High:   Medium:   Low:   Long, > 5 Years:   Medium, 5 Years > - > 3 Years:   Short, 3 Years > - > 1Years:   Brief, < 1 Year:	Class A					
(Interfaces, International Partnerships,	High:	Class B					
Technologies, Ability to Reservice,	$\begin{array}{c c} \mbox{Very High:} & \ C \ \\ \mbox{Very High:} & \ C \ \\ \mbox{High:} & \ C \ \\ \mbox{High:} & \ C \ \\ \mbox{Medium:} & \ C \ \\ \mbox{Low:} & \ C \ \\ \mbox{Medium, 5 Years > - > 3 Years:} & \ C \ \\ \mbox{Medium, 5 Years > - > 3 Years:} & \ C \ \\ \mbox{Short, 3 Years > - > 1 Years:} & \ C \ \\ \mbox{Short, 3 Years > - > 1 Years:} & \ C \ \\ \mbox{Brief, < 1 Year:} & \ C \ \\ \mbox{Medium:} & \ C \ \\ \mbox{Medium:} & \ C \ \\ \mbox{Medium:} & \ C \ \\ \mbox{Medium to Low:} & \ C \ \\ \mbox{Medium to High} & \ C \ \\ \mbox{Medium to Low:} & \ C \ \\ \mbox{Medium to Low} & \ \\ Medium to Low$	Class C					
Sensitivity to Process Variations)		Class D					
	High :	Class A					
Life Cycle Cost	Medium to High	Class B					
Life-Cycle Cost	Medium :	Class C					
	Medium to Low	Class D					

### **Combining All Four Case Studies**

- All the various pieces of the estimate contribute to total cost in a big way
- Critically important to understand what is being procured and how
- These case studies are not done in a vacuum!
  - Errors are related and additive

Share methods (and access guidance) when non-proprietary Share tools and models when non-proprietary

#### What Can Be Done to Enhance Collaboration?

Adopt a consolidated normalization guide and Standard WBS

Follow best practices for Method Development (see backup slide)

## Benefits of A Standardized Framework

#### Intra-Company

Supplement to existing training content on parametrics and cost models

A basis for a Space Systems Community of Practice

#### Intra-Agency/Office

Established tool for clients without a native parametric estimating capability

Adaptable, customizable framework for clients with a native parametric estimating capability

Efficient development of AoAs & other trades

#### Intra-Community

Recommendations for methods sharing and community adoption

More relevant training; faster onboarding to space systems projects

More standardized support and improved base capabilities

**~6+** month improvement vs. 'fromscratch' model development

~50% improvement in updating existing client-specific models

Clients without current AoA capability will have it by default

Help clients increase their influence in the space community

### Takeaway & Next Steps

• Development of SPACEFRAME and results of case studies show clear need for transparent estimating methods to enable collaboration

- Moving forward, team focus is on the following:
  - Ecosystem development to enable further modeling work
    - Data Collection Policy, Data Structuring, Automated Methods Updates/Development
  - 'Space Estimator' training enabling scalability; educate customers and new analysts alike
